

## 6. Entrance Behaviour

---

### 6.1 Characteristics of ICOLLS

Intermittently closed and open lakes and lagoons (ICOLLS) are created in wave-dominated entrances when the wave action becomes so dominant that entrance closure occurs on an intermittent basis (Hanslow et al. 2000). ICOLLS go through a cyclical process of infilling and berm formation due to wave action and subsequent breaching and scour due to fluvial action.

Due to their intermittent closure ICOLLS are linked to specific management issues such as water quality problems, periodic flooding of areas below berm level, algal blooms and odour. Over three-quarters of the ICOLLS in NSW are artificially opened for reasons of poor water quality or flooding. The most common justification for the artificial opening of lagoon entrances is for flood mitigation (Lugg 1998). This is also the case for Killick Creek, which is part of the Macleay Flood Mitigation Scheme and is kept open as an ocean outlet. If the ocean outlet were not kept open flooding of adjacent areas would increase, dependent on the height of the entrance berm, the level of drainage in the hinterland, and entrance conditions at Ryans and Big Hill cuts.

The hydrology of the creek is determined by the frequency and duration of entrance opening. Lagoons with permanently open entrances, such as Killick Creek, tend to have relatively stable water levels, varying across the tidal range on a twelve-hour cycle (Lugg 1998). Salinity also tends to be stable, varying from saline during dry periods and near-fresh during floods.

Under natural conditions the frequency and duration of closure of estuarine entrances is influenced by a number of factors including the morphology of the entrance site, exposure of the entrance site to the processes of 'longshore drift', the size of the catchment, the tidal prism and prevailing climatic conditions (Lugg 1998). Killick Creek, like many other estuaries, has a stabilised entrance with a training wall. Together with periodic dredging programs this maintains a permanently open entrance channel. Regular artificial opening can degrade wetland and riparian vegetation, reduce fishery production in the long term and contribute to a decline in regional biodiversity (Hanslow et al. 2000).

ICOLLS have a natural breakout range and an artificial opening within this range is not likely to have significant environmental effects, and can be considered part of the natural variation of the system. Continued artificial opening of the entrance at a level within the natural range is likely to have significant impact since the frequency distribution will be altered (Lugg 1998). Continued artificial opening at a level outside the natural range is expected to have large impacts on the system, especially on ecological processes. Conceptual frequency distribution curves for natural and artificial breakouts are presented in Figure 6.1.

## 6.2 Historical Assessment of Entrance Characteristics

### 6.2.1 Wave Climate

The wave climate may be inferred from data from the Crowdy Head Waverider buoy operated by MHL which is located in 79 m of water about 10 km east of Crowdy Head (approximately 70 km south of Crescent Head). Long-term statistical analysis of this data is available from 10 October 1985 to date and includes deepwater wave direction from hindcasting from October 1985 to December 1996. A summary of wave height exceedance statistics for the period 10 October 1985 to 31 December 1999 is shown in Figure 6.2 and directional statistics are presented in Figure 6.3.

### 6.2.2 Storm History

Storms are generally defined as events in which the significant wave height ( $H_s$ ) exceeds 3 m. Storm events recorded by the Crowdy Head Waverider buoy from 1985 to 1999 where  $H_s$  exceeded 5 m are listed in Table 6.1.

**Table 6.1 Occurrence of Significant Waves  $H_s > 5$  m at Crowdy Head for period 1985 to 1999**

Storm Start Date	Storm End Date	Peak $H_s$ (m)	Mean $T_s$ (s)	Peak Direction

As waves propagate from deep water onto the continental margin their speed and direction may be altered by the decreasing water depth. Waves approaching at an angle are refracted, or bent, such that their wave crests tend to align more parallel to the shore. The net longshore transport rate depends on the prevailing wave conditions. At Crescent Head the dominant angle of approach of waves (neglecting local wind waves) is from between east and south with waves from between north and east occurring less than 5% of the time. Net longshore transport is consequently strongly to the north.

### **6.3 Effect of Sea Level Rise on Entrance Conditions**

Over the next 100 years the global mean temperature and sea level are expected to rise due to an increased 'greenhouse effect'. The greenhouse effect is a predicted global warming associated with the build-up of certain gases in the atmosphere. Greenhouse gases are essentially transparent to incoming short-wave solar radiation, but they absorb the longer wavelength infrared radiation (heat) emitted by the earth. Thus heat is trapped in the atmosphere and the global temperature is increased.

The most up-to-date estimates of temperature and sea level rise are those provided by the International Panel on Climate Change (IPCC). In the third assessment report of 2001 (Albritton et al. 2001), the IPCC predicts an increase of global-averaged surface temperature of 1.4 to 5.8°C over the period 1990 to 2100. The range is due largely to uncertainty in the amounts of greenhouse gases which nations will emit and the use of a variety of different climate models. The projected temperature increases are higher and display a wider range than those in the IPCC second assessment report of 1995 (Houghton et al. 1996). Since then a greater understanding of climate change has developed due to improved data analysis and modelling techniques.

Global warming is associated with sea level rise as a result of thermal expansion of the oceans and melting of glaciers and ice-sheets. Despite higher temperature change projections in the IPCC third assessment report, the sea level rise projections are slightly lower compared to earlier assessments. This is due to improved models which give a smaller contribution from glaciers and ice-sheets. The latest projected global mean sea level rise is 0.09 to 0.88 m between 1990 and 2100 (Albritton et al. 2001).

Increased sea level is expected to lead to general beach recession. Concerning ICOLLS, beach recession is expected to be accompanied by landward and upward translation of the entrance berm (Hanslow et al. 2000). This results in higher lagoon levels and a higher flood risk to shoreline development.

Besides sea level and temperature rise another possible effect of climatic change is a change in weather patterns through changes in wind and precipitation patterns. These changes may severely affect coastal areas, including foreshore alignment and stability, siltation, shoal formation and foreshore inundation levels. These potential changes need to be accommodated in planning foreshore development, facilities and services.

#### **6.4 Berm Height and Flooding**

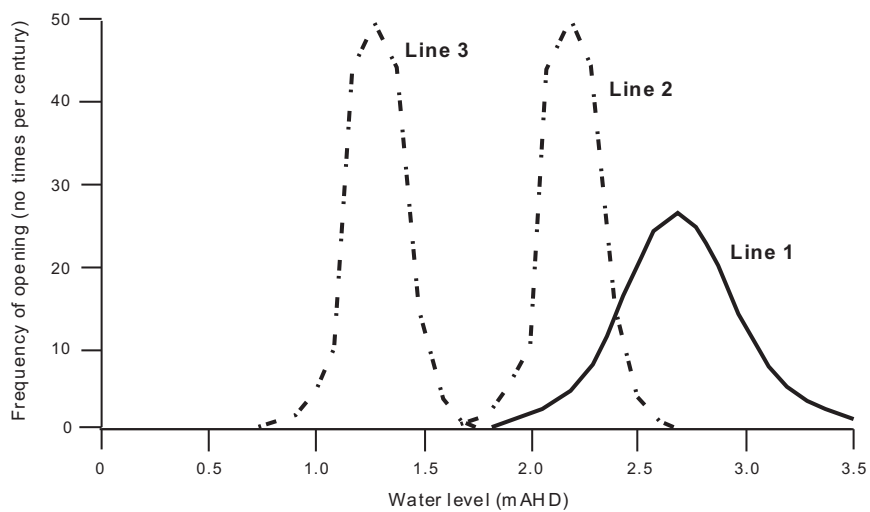

Berms are depositional features on beaches that develop as a result of wave runup and overwash. Berm development represents the final stage in an entrance closure. The formation of berms (shown in Figure 6.4) occurs when sediment is deposited near the limit of wave runup as the wave velocity decreases due to gravity, friction and percolation. If the wave height remains constant vertical growth of the berm continues until the berm height equals the maximum height of the wave runup. Higher waves produce higher berms but above the critical erosion-accretion threshold higher waves erode the beachface leading to rapid berm removal (Hanslow et al. 2000).

The hydraulics and water flows of the upper Belmore River, Connection Creek and Killick Creek, Ryans Cut and Big Hill drains is highly complex. The Killick Creek waterway is only a small fraction of this system. In the event that the Killick Creek entrance is permanently maintained in an open condition the flooding of the hinterland or upper Belmore area will continue to drain through Killick Creek alleviating flooding in these areas. The details of the water flows during such an event are not well understood and should be further investigated to assist with an assessment of the entrance management options.

#### **6.5 Effects of Opening Strategies on Fringing Flora and Fauna**

Clearly it is important to consider the impact of floodgates as well as the opening and closing of the creek mouth. For example, two commercially important prawns occurring in NSW (king prawns, *Penaeus plebejus* and school prawns, *Metapenaeus macleayi*) are known to migrate out of estuaries into the ocean to spawn. This migration occurs typically in late summer and autumn and there is compelling evidence that these migrations are triggered by flood events (Racek 1959, Ruello 1973, Glaister 1978). Glaister (1978) advised that changes to flood regimes within estuaries could affect the movement of prawns and potentially affect fisheries targeting these species. Second, sea mullet (*Mucil cephalus*) migrate from the upper reaches of estuaries to sea at two stages in their life cycle. The spawning migration of sea mullet typically occurs in autumn in NSW and appears due to the onset of westerly winds rather than flooding. Larval sea mullet are carried by currents back into estuaries, where they settle in suitable nursery habitat, often including shallow, brackish and freshwater backwaters and wetlands (TEL 1996). Third, Australian bass (*Macquaria novaemaculata*) normally reside in the freshwater upper reaches of estuaries along Australia's east coast. Bass migrate to the brackish reaches of estuaries in winter to spawn, typically in response to flooding. After spawning, the adults migrate back up the river and are followed by small juveniles migrating to upstream nursery habitats. There are several other, less well understood movements (SPCC 1981) such as the movements of yellowfin bream, luderick and sand whiting from estuarine habitats to rocky headlands and/or ocean beaches adjacent to estuaries to spawn; the reported movement of mullocky to spawn at the entrance to or the mouths of estuaries; and the reported movement of several freshwater fishes from the headwaters into brackish waters to spawn.

Physical changes to estuaries may affect these movements by affecting the cues triggering migration (e.g. by changing the hydrodynamic regime) or by imposing obstacles to movement (e.g. flood mitigation works). It is often difficult, however, to demonstrate unambiguously an effect due to these physical changes because of natural variability in populations and environmental conditions. Moreover, as is the case in the Macleay, such barriers may occur in different parts of an estuary and there is a need to distinguish which areas are being or have the potential to be affected. There is also a need to assess the relative impact of specific obstacles on the estuarine ecosystem (TEL 1996).

**Line 1** - Natural breakout frequency curve. Upper and lower limits define natural breakout range

**Line 2** - Artificial breakout frequency curve for a level set within the natural breakout range (in this case 2.2m)

**Line 3** - Artificial breakout frequency curve for a level set below the natural breakout range (in this case 1.3m)

(Note: each of these lines represents exactly the same frequency of breakout i.e. 1.75 times per century)

## 7. Estuary Sediments

---

### 7.1 Introduction

A study undertaken by the University of New England in 1992 (UNE 1993) investigated the physio-chemical characteristics of the creek. In particular, information was collected on depth, volumes, tidal flux, water quality and sediment quality. It was found that sediments were mostly fine sands with varying amounts of silt and pebble depending on site. Areas where the creek deepens and widens (e.g. the junction with the flood cutting) had high organic content and high oxidisable sulfur content in sediments. Substantial quantities of organic matter accumulate in these depressions due to inadequate scouring. Sediments in depressions in the upper reaches of the estuary are characterised by an abundance of partly decomposed organic matter (black ooze) which forms the bulk of the reservoir of material with a high potential oxygen demand.

The black ooze is essentially organic-rich mud that is highly productive and generally anoxic. It is typically found in NSW coastal lakes such as Lake Ainsworth and Lake Curralo. The ooze contains considerable store of nutrients and may at times drive the nutrient balance of the system. While it is unpleasant to the human nose when exposed, it forms an important contribution to the nutrient budget and algal blooms.

A conceptual model of estuarine sedimentation in Killick Creek has been produced based on results of previous studies on similar systems and preliminary observations (Figure 7.1). Limited sediment sampling by DLWC conducted in 2001 qualitatively confirms the boundaries shown in Figure 7.1.

Major depositional environments within the study area include sandy fluvial deltas and estuarine mud basin deposits. The fluvial deltas occur in the entrance of the creek and are comprised of coarse-grained marine sands washed in by wave action and by wind erosion from the beach/dune. Mud basin sediments (organic rich muds and sandy muds) accumulate in the deeper sections of the estuary further away from the entrance and appear to be derived from both local (Killick catchment) and remote (Macleay River catchment) sources.

Surrounding soils are mostly sandy Pleistocene/Holocene deposits of marine sands. These sediments erode and result in some infilling of the system. Anecdotal evidence (from local residents) suggests the creek originally had some deep holes (>5 m deep) that have infilled since the 1950s. It is not possible after the event to confirm the veracity of these statements nor to quantify the rate of infill. A number of processes and activities could have led to accelerated infilling including clearing of dunes, realignment of the entrance, construction of roads and drainage channels etc.

## **7.2 Denitrification Efficiency**

Denitrification efficiency refers to the biological 'self cleaning' ability of an estuarine ecosystem to convert bio-available nitrogen into unavailable nitrogen gas. Denitrification is an important process as it reduces the quantity of available nitrogen in the water column and thus restricts the development of harmful or excessive algal blooms. The process is carried out by groups of bacteria inhabiting the estuarine sediments.

The denitrification process has two steps and requires certain environmental conditions to proceed efficiently. The first step is 'nitrification' which involves the conversion of ammonium to nitrate and requires the presence of oxygen. The second step (denitrification) uses the nitrate in the breakdown of organic matter and produces nitrogen gas, requiring sufficient organic matter and nitrate. Denitrification efficiency can be impaired by chronic algal blooms as the breakdown of large amounts of algal material depletes oxygen in the water and sediments, stopping the process at the initial nitrification step.

Direct measurement of denitrification efficiency involves the collection and incubation of sediment cores and subsequent laboratory analysis using membrane inlet mass spectrometry. This procedure has not been undertaken in the Killick Creek estuary. The closest study performed was in the Brunswick estuary, where it was found that denitrification efficiency reduced towards the middle and upper sections of the estuary during the occurrence of large algal blooms (MHL 2000). The denitrification efficiency rates for most of the sites in the study were similar when compared with other shallow sub-tropical estuaries, although they were extremely high compared to efficiencies measured in other estuarine systems around the world.

It is recommended that measurements of denitrification efficiency be undertaken in Killick Creek at various temporal and spatial scales, as it has been suggested as a potentially useful health indicator in shallow sub-tropical estuaries where benthic microalgae and bioturbation are prevalent.

## **7.3 Littoral Transport**

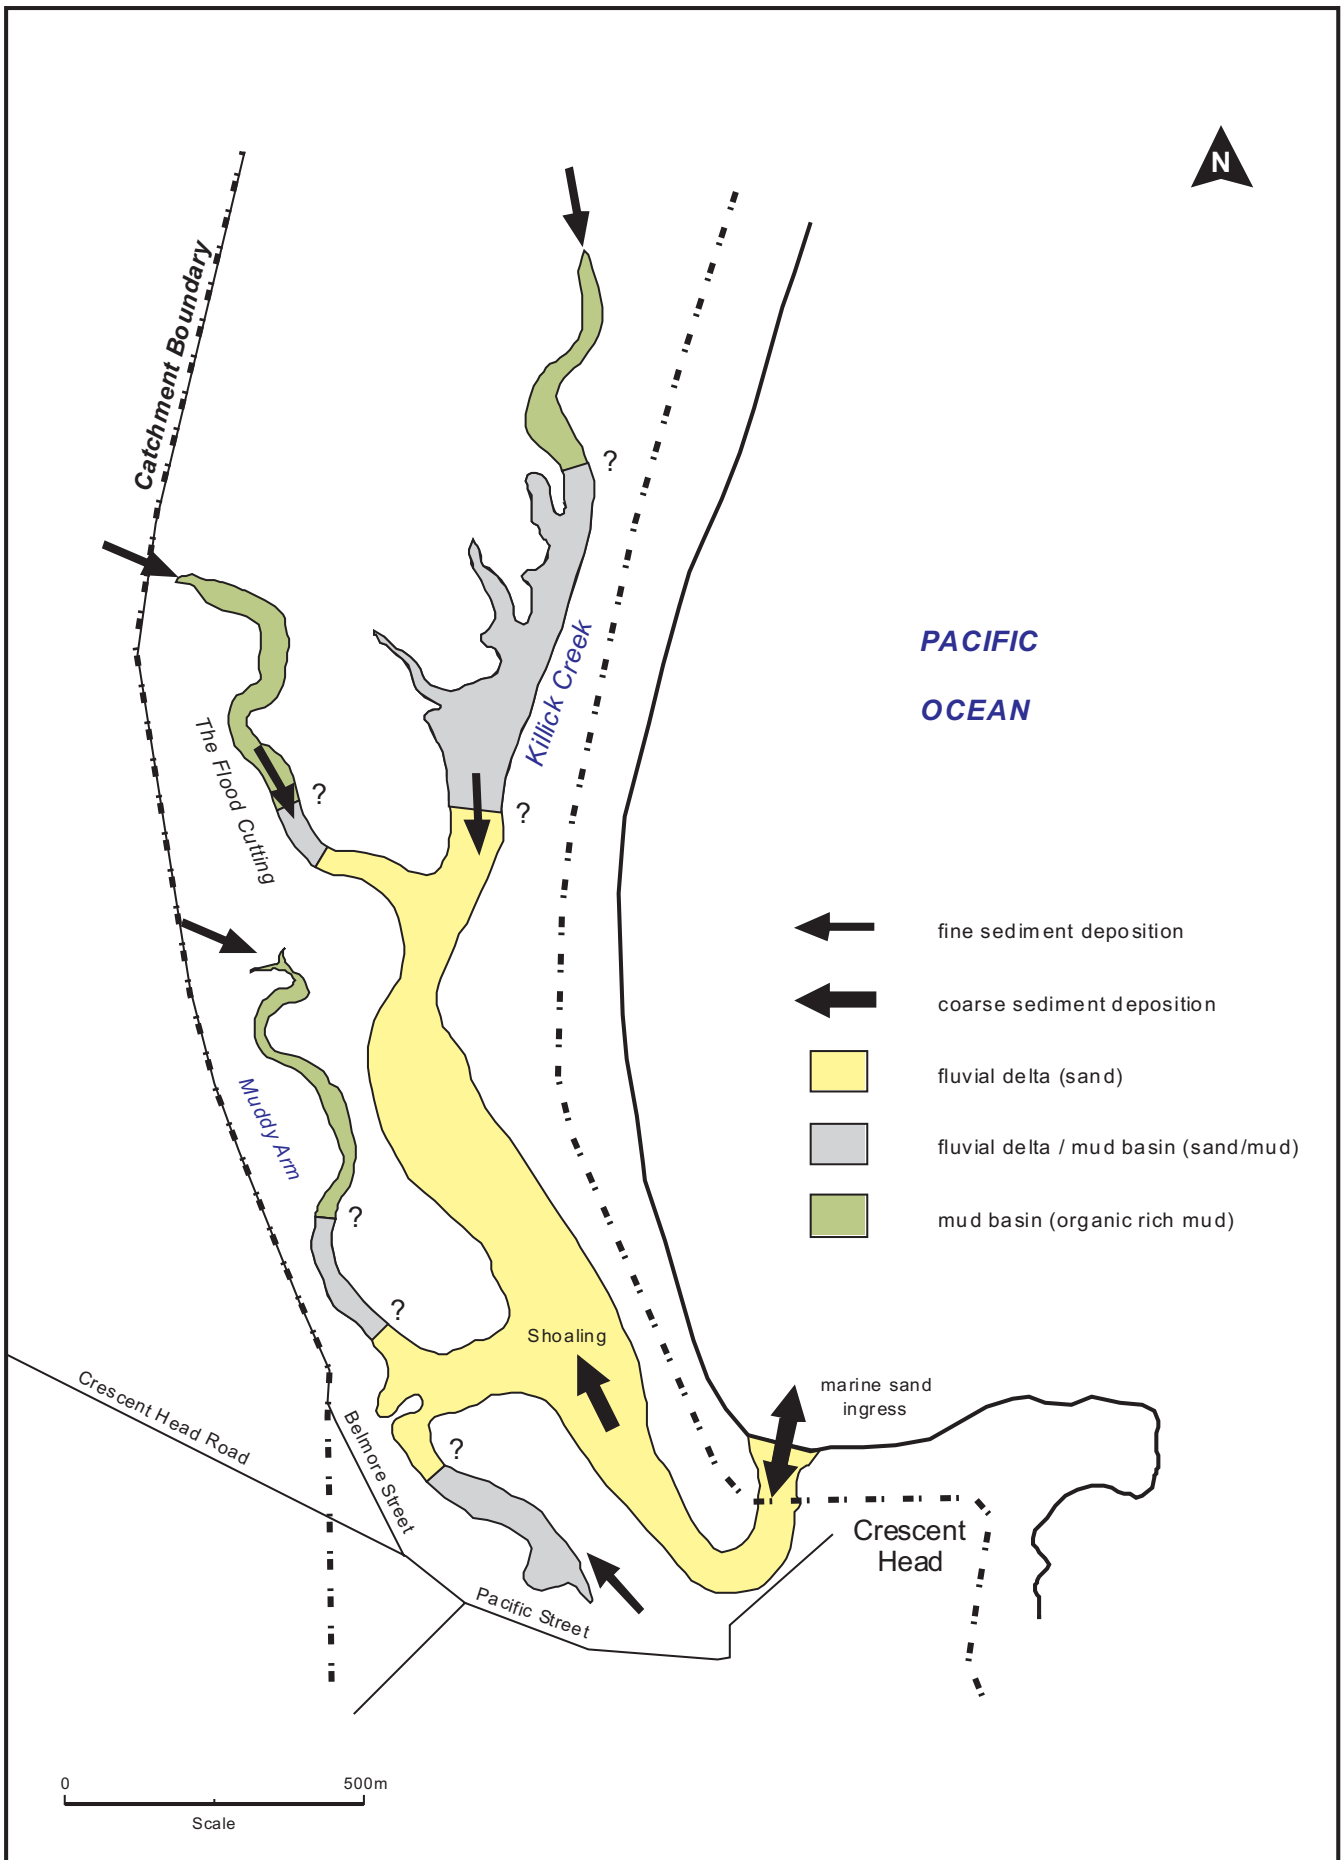

The entrance sediment dynamics are influenced by the littoral sediment transport along the beach, transport within the channel due to tidal and flood flow currents and aeolian sand drift along the aerial beach. The entrance channel is comprised of marine sands indicating a net ingress of marine sediments.

There are no known studies of littoral transport rates in the vicinity of Crescent Head and in particular near the Killick Creek entrance. In general there is a south to north littoral drift along the NSW coast. The magnitude of the drift increases towards the north but near Crescent Head it is thought that littoral transport rates are generally low. It would appear that a large sandy area exists off the entrance. The movement of this sand in response to storms and flood flows from the creek is not well understood. Certainly the local surfers report a seasonal migration of the sand bars but whether there is a net gain or loss of sand remains unknown. For the purpose of this study the important aspects include the movement of sand near the creek entrance and the potential for reshaping the entrance morphology.

Marine sediment transport along the beach is driven by the ocean waves, including long period ocean swell and locally generated wind waves, and the littoral currents due to wind and tides. The tidal currents along the beach (away from the entrance) are generally small and do not significantly affect the littoral transport. The combination of waves and wind-driven currents cause sediment movement both along and on/off the beach. The alongshore transport along the beach moves sediment towards the entrance resulting in a net movement into the entrance.

At times of entrance closure the alongshore sediment movement contributes to a gradual buildup of sand on the frontal dunes to the north of the entrance. This system presumably existed some time prior to the 1950s before the present entrance maintenance strategy.

Marine sediment movement into the estuary effectively causes a gradual shoaling or blocking of the entrance until a significant rainfall event or artificial means are used to open it. Within the estuary the shoaling and accretion patterns are a result of the sediment transport processes. Shoaling around the entrance to Muddy Arm has been noticed for some years and in recent times the mouth of Muddy Arm has been an area with a large shoal.

## 8. Issues for Future Management

---

### 8.1 Key Issues Identified by Committee

The following issues were raised by the Killick Creek Working Party and the Coastal and Estuary Management Committee and were outlined in the brief.

- ✦ Water quality
- ✦ Salinity
  - Water quality of Scotts/Belmore/Kinchela drains and the impact on Killick Creek
  - Effect of Killick inundation of Belmore, Kinchela and Scotts drains and Belmore swamp area
  - Death of vegetation in freshwater swamp
  - 20 years saline incursion
  - Seawater inundation of local farmland.
- ✦ Stormwater
  - Effect of pollution on the health and recreational use of Killick Creek, tourism at Crescent Head and environs
  - Faecal coliform and contaminant (pesticides, insecticides and chemical residues) concentrations
  - Robust sample design
  - Runoff from the bowling green.
- ✦ Recreational use
  - Water quality within guidelines for swimming and recreational use now and in the future.
- ✦ Entrance management
  - Entrance shoaling, need for improved flushing
  - Entrance management scheme
  - Location and orientation of creek entrance
  - Berm heights – natural cycle of heights and widths
  - Protection of sand dune
  - Recreational access to ocean considers all groups
  - Communication by Council to local recreational groups.
- ✦ Ecology
  - Natural functions of Killick Creek
  - Extent of change to flora and fauna
  - Effect of flood mitigation on natural creek function
  - Wetland management
  - Fish stock depletion
  - Red weed access during north-east winds and king tides.

- ◆ Sediments
  - Black ooze in bottom sediments and effect on ecology (particularly in flood cutting)
  - Siltation of upper and lower sections of Killick Creek.
- ◆ Flood mitigation
- ◆ Floodgate management
  - Has flood mitigation become swamp drainage?
  - Explore ways of mimicking natural system functions
  - Maximise benefit for landholders and environment
  - Prevent scalding of pasture from saline incursion
  - Retain fresh water on wetland areas.
- ◆ Drains
  - Belmore Killick drain depth.

## **8.2 Key Issues Identified by Community**

In addition, issues were discussed at the community meeting held in early April 2001. Issues identified as important to the community are listed below.

- ◆ Recreational access – to ocean for boats, swimmers and surfers
- ◆ Water quality of the creek – fish kills, red weed, high bacteria levels
- ◆ Water quality of surrounding areas – Scotts drain (acid, oxygen)
- ◆ Stormwater and runoff from residential areas
- ◆ Sediments – sand accretion, siltation of the creek
- ◆ Flushing
- ◆ Floodgate management
- ◆ Effect of past modifications
- ◆ Community consultation
- ◆ Rehabilitation of wetlands
- ◆ Acid sulphate soils
- ◆ Leachate from old rubbish tip.

Attendees at the meeting were asked to identify features of the estuary that they consider valuable. The most common response was the value of the estuary for future generations and as a recreational and natural amenity now. Protection of the foreshore, bushland and habitats were considered important as well as its drainage capacity for farmland in the Belmore Swamp areas.

The community was asked which of the valuable features were important to preserve and identified the natural habitats and features of the creek, access and recreational usage, water quality and water depth and a protected zone between development and the creek. Options for management of the creek were discussed.

### **8.3 Recommendations for Further Work**

#### *8.3.1 Community Values*

The community wishes to preserve Killick Creek estuary as a healthy habitat for recreational and amenity purposes. This aspiration needs to be balanced by due consideration of the flood mitigation requirements of the Belmore Swamp/Connection Creek areas. An important aspect that has been affected by this flood mitigation system is water quality and its flow-on effects on the ecosystem. There are also natural inputs of algae from the ocean that can be trapped within the estuary, where their breakdown often leads to unsightly water colour and odour issues. It must be remembered that the Killick Creek system has been subject to a number of modifications that prevent it from being returned to a pre-European 'natural' condition.

#### *8.3.2 Previous Recommendations*

It is useful to review the recommendations put forward by the University of New England study (1993) in early 1993. They reported on the following changes suggested by Yates (1980) for improving water quality in Killick Creek:

- ✦ improve tidal exchange by increasing the cross-sectional area of the creek mouth
- ✦ periodic removal of accumulated organic matter from the lagoon
- ✦ relocation of the floodgates to improve tidal flushing.

All three options were considered unsuitable by Kempsey Shire Council. The first two options would only provide temporary improvement and require ongoing maintenance. Removal of the floodgates was considered unsuitable because saltwater penetration upstream may result in loss of pastoral land.

The UNE study itself identified three ways to reduce the frequency and intensity of dissolved oxygen depletion events in the Killick Creek estuary system; either the normal flushing rates need to be increased, or the rate of accumulation of oxidisable matter in the system needs to be reduced, or the availability of oxygen to the system needs to be increased (i.e. the Eh is raised). These mechanisms were translated into four management strategies, which could be used alone or in combination:

- ✦ the periodic opening of the floodgates during periods of 'normal' flow
- ✦ reduction of the volume of water in the deeper pools in the upper estuary by partly filling in the depressions with sand extracted from near the mouth of the creek
- ✦ construction of a tidally influenced artificial lake west of the junction between the flood cutting and Killick Creek and connected to the estuary by a canal to increase effective tidal inflow and flushing
- ✦ installation of a fountain either in the artificial lake or in the creek near the lake to aerate the less well-oxygenated estuary water.

It was considered unlikely that any of the above suggested management options would have a detrimental effect on the fauna of Killick Creek (UNE 1993).

### 8.3.3 Recommendations from this Study

In order to address the issues of concern identified by the community and to improve the understanding of the Killick Creek system a well-defined management plan must be initiated. At present there are a number of concerns for which the available information is not sufficient to make a reasonable assessment of the likely impacts of management decisions. Hence the plan will need to address those areas requiring further investigation to support the process of defining and assessing the merits of management options. It is recommended that such a plan for additional monitoring adopt the approach specified in the Australian Guidelines for Water Quality Monitoring and Reporting (ANZECC 2000) to provide clear definition of management objectives and desired outcomes. To ensure that outcomes are meaningful the process recommended by ANZECC (2000) requires establishment of overall study objectives and a detailed study design, including preparation of a field sampling program and laboratory analysis protocol. Collected data should be quality controlled and retained in a robust database in a central location for access in future years when comparative assessments may be required.

Examples of studies that are required to enhance understanding and improve management of the Killick Creek system are listed below. Assessment of the prioritisation and need for these studies will be based on the strategies resulting from the Management Study. In addition, a strong association needs to be forged between the Coastal and Estuary Management Committee and the recently formed Mid North Coast Catchment Board, with its potential role in funding.

- ◆ *Flooding* - Since Killick Creek is formally connected to the Macleay Flood Mitigation Scheme via Killick drain and Connection Creek it has become part of a complex hydrodynamic system affecting its natural functioning. It is clear that the hydrodynamics of the estuary, including the operation of the floodgates, greatly influence the estuary ecosystem. It is also possible that closing the Killick drain to the flood mitigation scheme would lead to a more marine environment and less variable water quality in Killick Creek than at present. If this option is to be considered, then further studies should be undertaken to assess the effects of removing Killick Creek from the flood mitigation scheme on other parts of the scheme. One possibility suggested by the local residents is to improve the capacity of Ryans Cut and Big Hill Cut to essentially divert those waters presently discharging via Killick drain.

It is recommended that a hydrological model study of these various cuts be carried out to assess the viability of diverting the flood waters that presently discharge through Killick Creek. These studies should be linked to the recommended studies into water quality and biota to gain a better understanding of the water quality processes and justification for possible modification to the flood mitigation scheme.

- ◆ *Land use practices* – Land use practices in the upper Belmore area have impacted drainage and water quality for a number of decades. As sea level rise and climate change are likely to increase the frequency of these impacts, through increased water levels and flooding, it is recommended that a study be conducted to assess future options for land management in the area including the important social effects on the local community and farmers. The inputs of stormwater from urban land use should also be investigated to assess their contribution to the system in terms of flow and water quality.

- ◆ *Entrance surveys* – Detailed surveying of the entrance at regular intervals and immediately after flood and storm events. This will provide greater understanding of entrance behaviour and relationships between water level and entrance condition. This may also include photographs taken from the surf club at hourly intervals over one day (ie. covering a tidal cycle) repeated on similar tides each three months. Alternatively, the approach could involve hydrological modelling and sand dune growth studies, including the sand dunes north of Crescent Head, to determine long-term changes in sediment and morphological characteristics.
- ◆ *Biota* – Detailed surveys of flora/fauna communities along the foreshores of the creek. Combined with good quality entrance survey information and water quality data the impact of the hydrological regime and catchment inflows on biota may be determined. Surveys should in particular consider the low-lying area of the catchment along and beyond the north arm of Killick Creek to determine the impact and extent of the estuarine system on biota in this area. An investigation into the role of red algae in water quality and odour issues should also be carried out.
- ◆ *Water quality* – Installation at a number of representative sites of continuous water quality monitoring devices capable of measuring chlorophyll-*a*, salinity, pH and flow. This will provide useful information regarding the dynamics of this high energy system and, in combination with the survey task described above, will enhance understanding of the effects of changing entrance conditions and floodgate operation on water levels and water quality. Examination of data from recent water quality monitoring in the upper Belmore and at the Killick Creek headworks will assist in assessing proposed monitoring requirements.

Water quality processes that may be investigated through short-term specific studies include an assessment of denitrification efficiency of the sediments and investigation of nutrient inflows to the creek and internal cycling within the creek during normal, wet and dry conditions.

- ◆ *Data collection, analysis and storage* – As mentioned above it is imperative that all data collection programmes be coordinated under a management plan to ensure that meaningful data is collected which provides quality input towards management outcomes. Details of data collection should be established at the outset, including proposed data acquisition, processing, interpretation, dissemination, application, access and custodianship. Data should be stored in a database and a framework for detailed analysis should be derived to allow interpretation after a significant period of data collection. Any data collected should be integrated or linked to the water quality of the upper Belmore.

The recommendations from this study should be incorporated into the Mid North Coast Catchment Blueprint.

**Community Consultation**

File No. LRE6-0107

26 February 2001

Mr S Sample  
Organisation  
Address line 1  
Address line 2

Dear Mr Sample,

#### KILLICK ESTUARY PROCESS STUDY

As you may be aware Kempsey Shire Council has commissioned the Department of Public Works and Services' Manly Hydraulics Laboratory to carry out the Killick Creek Estuary Process Study. To assist in this project Manly Hydraulics Laboratory have engaged the services of subconsultants, The Ecology Lab Pty Ltd to assist with ecological issues.

#### *Need for a Process Study*

Killick Creek has substantial benefit for the local economy. It is also important visually and as a recreational facility for the local community and visitors to the area. The creek provides a safe swimming environment and attracts day picnickers and tourists. The adjacent Caravan Park and beach attract large numbers especially during the Easter, Christmas and school holidays. There is concern however, about the water quality in the creek.

In the preparation of planning measures for the future it is necessary to gain an understanding of the natural processes and their interactions with a range of activities that may affect this balance.

#### *Project Process and Timing*

The process study will take place in two stages. The first stage involves an intensive review of literature and information on the area and the identification of issues of importance to the community. Stage two involves investigation into processes operating in the creek and in similar systems, and production of a report including recommendations which will form a starting point for the development of a plan of management for the estuary.

We are currently at the beginning of stage one and seek your help to gather as much information on the system as possible.

*What can you do to help?*

If you have any information that may be of use in the study either:

- ◆ Make a written statement – written submissions can be made in relation to the project and should be sent to Manly Hydraulics Laboratory at the address below.
- ◆ Send information to Kempsey Shire Council – any information in relation to the project, photos, data collected etc. can be delivered to Kempsey Council at the address below.

Killick Creek Estuary Process Study  
Manly Hydraulics Laboratory  
110B King St  
MANLY VALE NSW 2093

Killick Creek Estuary Process Study  
Kempsey Shire Council  
Civic Centre, Cnr Elbow & Tozer Sts  
WEST KEMPSEY NSW 2440  
Attn: Mr Tom Vermeulen

**In order to progress the project please provide any written submissions or data that you may have by 20 April 2001.**

**If you require any submitted data (eg. photos) to be returned, please indicate in your submission and provide a return address.**

**We thank you very much for your assistance and look forward to reviewing the information shortly.**

A community meeting will follow the receipt and synthesis of material relevant to Killick Creek. Information will be provided on the processes operating in the creek and a discussion will take place on the issues of importance to the community.

Regards,

David van Senden  
Principal Engineer  
Manly Hydraulics Laboratory

## **Appendix C**

### **Flora and Fauna Lists**

Table C.1. List of fish recorded in Killick Creek by UNE and SCU (1993) and Richardson (1980).

Common Name	Scientific Name	UNE and SCU (1993)	Feb. 1978 Richardson (1980)	March 1978* Richardson (1980)	June 978 Richardson (1980)
Australian bass	<i>Macquaria novemaculeata</i>				X
Estuary perch	<i>Macquaria colonorum</i>		X	X	
Double-ended pipefish	<i>Syngnathoides biaculeatus</i>	X			
Yellow-finned leatherjacket	<i>Cantherines trachylepis</i>	X			
Three-bar porcupine fish	<i>Dicotylichthys punctulatus</i>	X			
Juvenile trumpeter	<i>Pelates quadrilineatus</i>	X			
Luderick	<i>Girella tricuspidata</i>	X	X	X	
Sand whiting	<i>Sillago ciliata</i>	X			
Dusky flathead	<i>Platycephalus fuscus</i>	X	X		
Mulloway (Jewfish)	<i>Argyrosomus hololepidontus</i>	X	X		
Bream	<i>Acanthopagrus australis</i>	X	X	X	
Silver biddy	<i>Gerres ovatus</i>	X	X	X	
Tailor	<i>Pomotomus salitrix</i>	X	X		
Golden trevally	<i>Gnathanodon speciosus</i>	X	X		
Big-eye trevally	<i>Caranx sexfasciatus</i>			X	
Large-toothed flounder	<i>Pseudorhombus arsius</i>	X			
Southern herring	<i>Harengula abbreviata</i>	X	X	X	
Freshwater herring	<i>Potamalosa richmondia</i>		X	X	X
Ox-eye herring	<i>Megalops cyprinoides</i>		X		
Sand mullet	<i>Myxus elongatus</i>	X			
Sea mullet	<i>Mugil cephalus</i>	X	X	X	X
Flat-tail mullet	<i>Liza argentea</i>		X	X	
Freshwater mullet	<i>Trachystoma petardi</i>		X	X	
River garfish	<i>Hyporhamphus ardelio</i>	X			
Butterfish	<i>Scatophagus argus</i>	X		X	
Toado	<i>Spheroides hamiltoni</i>	X			
Weeping toado	<i>Spheroides pleurogramma</i>	X			
Diagonally banded toado	<i>Arothron aerostaticus</i>	X			
Bullrout	<i>Notesthes robusta</i>	X	X		X
Southern bullrout	<i>Centropogon marmoratus</i>	X			
Perchlet	<i>Velambassis jacksoniesis</i>		X	X	
Yellow perchlet	<i>Priopidichthys marianus</i>	X			
Bull shark	<i>Carcharhinus leucas</i>		X	X	
Mosquito fish	<i>Gambusia holbrooki</i>			X	
Short-finned eel	<i>Anguilla australis</i>			X	
Flathead gudgeon	<i>Philypnodon grandiceps</i>			X	
Goby (UID)		X			
Angelfish (UID)		X			

\*Dead fish identified after fish kill.

Table C.2. List of birds, amphibians, mammals and reptiles observed within approximately 20 km of Killick Creek (NSW NPWS Wildlife Atlas) and their protected status under the TSC Act (1995). E1 = Endangered, V= Vulnerable, I = Introduced, P = Protected (NSW Wildlife Act, 1974), U = Unprotected. (nb: These data are only indicative and cannot be considered a comprehensive inventory, and may contain errors). Vulnerable and endangered species have been shaded.

		Scientific Name	Common Name	Legal Status	Count
Amphibia	Hylidae	<i>Litoria aurea</i>	Green and Golden Bell Frog	E1	17
		<i>Litoria caerulea</i>	Green Tree Frog	P	2
		<i>Litoria chloris</i>	Red-eyed Tree Frog	P	1
		<i>Litoria dentata</i>	Bleating Tree Frog	P	3
		<i>Litoria fallax</i>	Eastern Dwarf Tree Frog	P	12
		<i>Litoria freycineti</i>	Freycinet's Frog	P	2
		<i>Litoria nasuta</i>	Rocket Frog	P	6
		<i>Litoria peronii</i>	Peron's Tree Frog	P	8
		<i>Litoria phyllochroa</i>	Leaf Green Tree Frog	P	2
		<i>Litoria tyleri</i>		P	1
	Myobatrachidae	<i>Adelotus brevis</i>	Tusked Frog	P	8
		<i>Crinia signifera</i>	Common Eastern Froglet	P	13
		<i>Crinia tinnula</i>	Wallum Froglet	V	12
		<i>Limnodynastes dumerilii</i>	Eastern Banjo Frog	P	1
		<i>Limnodynastes ornatus</i>	Omate Burrowing Frog	P	2
		<i>Limnodynastes peronii</i>	Brown-striped Frog	P	16
		<i>Mixophyes fasciolatus</i>	Great Barred Frog	P	8
		<i>Mixophyes iteratus</i>	Giant Barred Frog	E1	1
		<i>Paracrinia haswelli</i>	Haswell's Frog	P	3
		<i>Pseudophryne bibronii</i>	Brown Toadlet	P	5
<i>Pseudophryne coriacea</i>	Red-backed Toadlet	P	19		
<i>Uperoleia fusca</i>		P	3		
Aves	Accipitridae	<i>Accipiter cirrhocephalus</i>	Collared Sparrowhawk	P	3
		<i>Accipiter fasciatus</i>	Brown Goshawk	P	4
		<i>Accipiter novaehollandiae</i>	Grey Goshawk	P	5
		<i>Aquila audax</i>	Wedge-tailed Eagle	P	2
		<i>Aviceda subcristata</i>	Pacific Baza	P	6
		<i>Circus approximans</i>	Swamp Harrier	P	9
		<i>Circus assimilis</i>	Spotted Harrier	P	1
		<i>Elanus axillaris</i>	Black-shouldered Kite	P	2
		<i>Haliaeetus leucogaster</i>	White-bellied Sea-Eagle	P	13
		<i>Haliastur indus</i>	Brahminy Kite	P	9
		<i>Haliastur sphenurus</i>	Whistling Kite	P	10
		<i>Hamirostra melanosternon</i>	Black-breasted Buzzard	V	1
		<i>Lophoictinia isura</i>	Square-tailed Kite	V	14
		<i>Pandion haliaetus</i>	Osprey	V	23
	Aegothelidae	<i>Aegotheles cristatus</i>	Australian Owlet-nightjar	P	22
	Anatidae	<i>Anas castanea</i>	Chestnut Teal	P	5
		<i>Anas gracilis</i>	Grey Teal	P	7
		<i>Anas platyrhynchos</i>	Mallard	U	1
		<i>Anas superciliosa</i>	Pacific Black Duck	P	12
		<i>Aythya australis</i>	Hardhead	P	4
		<i>Chenonetta jubata</i>	Australian Wood Duck	P	6
		<i>Cygnus atratus</i>	Black Swan	P	5
		<i>Tadorna radjah</i>	Radjah Shelduck	P	1
		Apodidae	<i>Apus pacificus</i>	Fork-tailed Swift	P
	Ardeidae	<i>Hirundapus caudacutus</i>	White-throated Needletail	P	6
		<i>Ardea alba</i>	Great Egret	P	6
		<i>Ardea ibis</i>	Cattle Egret	P	5
		<i>Ardea intermedia</i>	Intermediate Egret	P	2
		<i>Ardea pacifica</i>	White-necked Heron	P	5
		<i>Botaurus poiciloptilus</i>	Australasian Bittem	V	1
	<i>Butorides striatus</i>	Striated Heron	P	2	

Table C.2. List of birds, amphibians, mammals and reptiles observed within approximately 20 km of Killick Creek (NSW NPWS Wildlife Atlas) and their protected status under the TSC Act (1995). E1 = Endangered, V= Vulnerable, I = Introduced, P = Protected (NSW Wildlife Act, 1974), U = Unprotected. (nb: These data are only indicative and cannot be considered a comprehensive inventory, and may contain errors). Vulnerable and endangered species have been shaded.

	Scientific Name	Common Name	Legal Status	Count
	<i>Egretta novaehollandiae</i>	White-faced Heron	P	10
	<i>Egretta sacra</i>	Eastern Reef Egret	P	3
	<i>Ixobrychus flavicollis</i>	Black Bittern	V	1
Artamidae	<i>Nycticorax caledonicus</i>	Nankeen Night Heron	P	2
	<i>Artamus cyanopterus</i>	Dusky Woodswallow	P	4
	<i>Artamus leucorhynchus</i>	White-breasted Woodswallow	P	5
	<i>Artamus personatus</i>	Masked Woodswallow	P	4
	<i>Artamus superciliosus</i>	White-browed Woodswallow	P	3
	<i>Cracticus nigrogularis</i>	Pied Butcherbird	P	6
	<i>Cracticus torquatus</i>	Grey Butcherbird	P	14
	<i>Gymnorhina tibicen</i>	Australian Magpie	P	14
	<i>Strepera graculina</i>	Pied Currawong	P	19
Cacatuidae	<i>Cacatua galerita</i>	Sulphur-crested Cockatoo	P	1
	<i>Calyptorhynchus funereus</i>	Yellow-tailed Black-Cockatoo	P	13
	<i>Calyptorhynchus lathami</i>	Glossy Black-Cockatoo	V	26
Campephagidae	<i>Coracina lineata</i>	Barred Cuckoo-shrike	V	1
	<i>Coracina novaehollandiae</i>	Black-faced Cuckoo-shrike	P	20
	<i>Coracina papuensis</i>	White-bellied Cuckoo-shrike	P	4
	<i>Coracina tenuirostris</i>	Cicadabird	P	10
	<i>Lalage leucomela</i>	Varied Triller	P	3
	<i>Lalage sueurii</i>	White-winged Triller	P	1
Caprimulgidae	<i>Eurostopodus mystacalis</i>	White-throated Nightjar	P	10
Centropodidae	<i>Centropus phasianinus</i>	Pheasant Coucal	P	2
Charadriidae	<i>Charadrius bicinctus</i>	Double-banded Plover	P	1
	<i>Charadrius mongolus</i>	Lesser Sand Plover	V	1
	<i>Charadrius ruficapillus</i>	Red-capped Plover	P	1
	<i>Elseyornis melanops</i>	Black-fronted Dotterel	P	2
	<i>Pluvialis fulva</i>	Pacific Golden Plover	P	1
	<i>Vanellus miles</i>	Masked Lapwing	P	12
	<i>Vanellus tricolor</i>	Banded Lapwing	P	2
Ciconiidae	<i>Ephippiorhynchus asiaticus</i>	Black-necked Stork	E1	15
Cinclosomatidae	<i>Psophodes olivaceus</i>	Eastern Whipbird	P	24
Climacteridae	<i>Climacteris erythrops</i>	Red-browed Treecreeper	P	7
	<i>Climacteris picumnus</i>	Brown Treecreeper	P	2
	<i>Cormobates leucophaeus</i>	White-throated Treecreeper	P	19
Columbidae	<i>Chalcophaps indica</i>	Emerald Dove	P	2
	<i>Columba leucomela</i>	White-headed Pigeon	P	7
	<i>Columba livia</i>	Rock Dove	U	2
	<i>Geopelia humeralis</i>	Bar-shouldered Dove	P	9
	<i>Geopelia striata</i>	Peaceful Dove	P	2
	<i>Leucosarcia melanoleuca</i>	Wonga Pigeon	P	16
	<i>Lopholaimus antarcticus</i>	Topknot Pigeon	P	7
	<i>Macropygia amboinensis</i>	Brown Cuckoo-Dove	P	10
	<i>Ocyphaps lophotes</i>	Crested Pigeon	P	7
	<i>Phaps chalcoptera</i>	Common Bronzewing	P	3
	<i>Phaps elegans</i>	Brush Bronzewing	P	4
	<i>Ptilinopus magnificus</i>	Wompoo Fruit-Dove	V	2
	<i>Streptopelia chinensis</i>	Spotted Turtle-Dove	U	6
Coraciidae	<i>Eurystomus orientalis</i>	Dollarbird	P	7
Corcoracidae	<i>Corcorax melanorhamphos</i>	White-winged Chough	P	1
Corvidae	<i>Corvus coronoides</i>	Australian Raven	P	8
	<i>Corvus orru</i>	Torresian Crow	P	4
	<i>Corvus tasmanicus</i>	Forest Raven	P	6
Cuculidae	<i>Cacomantis flabelliformis</i>	Fan-tailed Cuckoo	P	8

	Scientific Name	Common Name	Legal Status	Count
	<i>Phylidonyris novaehollandiae</i>	New Holland Honeyeater	P	2
	<i>Plectorhyncha lanceolata</i>	Striped Honeyeater	P	5
	<i>Xanthomyza phrygia</i>	Regent Honeyeater	E1, Ea	1
Menuridae	<i>Menura novaehollandiae</i>	Superb Lyrebird	P	5
Meropidae	<i>Merops ornatus</i>	Rainbow Bee-eater	P	3
Motacillidae	<i>Anthus novaeseelandiae</i>	Richard's Pipit	P	4
Muscicapidae	<i>Zoothera dauma</i>	Unidentified Ground Thrush	P	1
Neosittidae	<i>Daphoenositta chrysoptera</i>	Varied Sittella	P	8
Oriolidae	<i>Oriolus sagittatus</i>	Olive-backed Oriole	P	10
	<i>Sphecothes viridis</i>	Figbird	P	12
Orthonychiidae	<i>Orthonyx temminckii</i>	Logrunner	P	3
Pachycephalidae	<i>Colluricincla harmonica</i>	Grey Shrike-thrush	P	19
	<i>Colluricincla megarhyncha</i>	Little Shrike-thrush	P	1
	<i>Falcunculus frontatus</i>	Crested Shrike-tit	P	8
	<i>Pachycephala olivacea</i>	Olive Whistler	V	1
	<i>Pachycephala pectoralis</i>	Golden Whistler	P	13
	<i>Pachycephala rufiventris</i>	Rufous Whistler	P	17
Pardalotidae	<i>Acanthiza chrysorrhoa</i>	Yellow-rumped Thornbill	P	1
	<i>Acanthiza lineata</i>	Striated Thornbill	P	16
	<i>Acanthiza nana</i>	Yellow Thornbill	P	6
	<i>Acanthiza pusilla</i>	Brown Thornbill	P	27
	<i>Acanthiza reguloides</i>	Buff-rumped Thornbill	P	5
	<i>Gerygone mouki</i>	Brown Gerygone	P	10
	<i>Gerygone olivacea</i>	White-throated Gerygone	P	6
	<i>Pardalotus punctatus</i>	Spotted Pardalote	P	21
	<i>Pardalotus striatus</i>	Striated Pardalote	P	2
	<i>Sericornis citreogularis</i>	Yellow-throated Scrubwren	P	3
	<i>Sericornis frontalis</i>	White-browed Scrubwren	P	11
	<i>Sericornis magnirostris</i>	Large-billed Scrubwren	P	8
Passeridae	<i>Lonchura castaneothorax</i>	Chestnut-breasted Mannikin	P	3
	<i>Lonchura punctulata</i>	Nutmeg Mannikin	U	2
	<i>Neochmia temporalis</i>	Red-browed Finch	P	23
	<i>Passer domesticus</i>	House Sparrow	U	2
Pelecanidae	<i>Pelecanus conspicillatus</i>	Australian Pelican	P	4
Petroicidae	<i>Eopsaltria australis</i>	Eastern Yellow Robin	P	19
	<i>Microeca fascinans</i>	Jacky Winter	P	4
	<i>Petroica multicolor</i>	Scarlet Robin	P	1
	<i>Petroica phoenicea</i>	Flame Robin	P	2
	<i>Petroica rosea</i>	Rose Robin	P	3
	<i>Tregellasia capito</i>	Pale-yellow Robin	P	2
Phalacrocoracidae	<i>Phalacrocorax carbo</i>	Great Cormorant	P	1

		Lissocampus runa	Javelin Pipefish	Listed
		Maroubra perserrata	Sawtooth Pipefish	Listed
Solegnathus dunckeri		Duncker's Pipehorse	Listed	
Solegnathus spinosissimus		Spiny Pipehorse	Listed	
Solenostomus cyanopterus		Blue-finned Ghost Pipefish	Listed	

Table C.4. List of fish, birds, amphibians, mammals, reptiles and plants likely to occur within the vicinity of Killick Creek protected under the EPBC Act (1999). The list includes species classed as threatened ecological communities, threatened species, marine protected species and migratory species.

	Scientific Name	Common Name	Legal Status
	<i>Solenostomus paradoxus</i>	Harlequin Ghost Pipefish	Listed
	<i>Stigmatopora nigra</i>	Black Pipefish	Listed
	<i>Syngnathoides biaculeatus</i>	Alligator Pipefish	Listed
	<i>Trachyrhamphus bicoarctatus</i>	Short-tailed Pipefish	Listed
	<i>Urocampus carinirostris</i>	Hairy Pipefish	Listed
	<i>Vanacampus margaritifer</i>	Mother-of-pearl Pipefish	Listed
Reptilia	<i>Chelonia mydas</i>	Green Turtle	Listed
	<i>Dermochelys coriacea</i>	Leathery Turtle, Luth	Listed
	<i>Hydrophis elegans</i>	Elegant Seasnake	Listed
	<i>Pelamis platurus</i>	Yellow-bellied Sea Snake	Listed

## **Appendix D**

### **Glossary of Terms**

## Appendix D Glossary of Terms

<b>accretion</b>	Deposition of sediment in the channel and on the banks of the estuary resulting in the growth of bars and other depositional features.
<b>acid sulfate soil</b>	Estuarine sediments in which metal sulfides (mainly pyrite) accumulate, and the subsequent dehydration of these sediments by evapotranspiration and/or disturbance which enables the oxidation of pyrite/sulfides to produce sulfuric acid.
<b>algal bloom</b>	The excessive growth of phytoplankton, generally caused by high nutrient levels. Can result in deoxygenation of the water mass, leading to the death of aquatic flora and fauna.
<b>anoxic</b>	A lack of oxygen in the water.
<b>Australian Height Datum (AHD)</b>	A common national plane of level corresponding approximately to mean sea level.
<b>bathymetry</b>	The measurement of depths of water; also information derived from such measurements.
<b>benthos, benthic organisms</b>	Organisms living in or on the bed of a waterbody.
<b>catchment</b>	The area draining to a site. It always relates to a particular location and may include the catchments of tributary streams as well as the main stream.
<b>dissolved oxygen</b>	Atmospheric oxygen that dissolves in water. The solubility of oxygen in water depends upon temperature and salinity.
<b>ebb tide</b>	The outflow of coastal waters from bays and estuaries caused by the falling tide.
<b>estuarine processes</b>	Those processes that affect the physical, chemical and biological behaviour of an estuary, e.g. predation, water movement, sediment movement, water quality, etc.
<b>estuary</b>	An enclosed or semi-enclosed body of water having an open or intermittently open connection to coastal waters in which water levels vary in a periodic fashion in response to ocean tides.
<b>estuary management process</b>	A sequence of activities starting with the formation of an Estuary Management Committee and culminating in the implementation of an Estuary Management Plan that will foster the balanced and sustainable use of estuaries.

<b>flood</b>	Relatively high stream flow which overtops the natural or artificial banks in any part of a stream or river.
<b>flood mitigation works</b>	Structures that are designed to manage floodwaters (e.g. levees, retarding basins).
<b>floodplain</b>	The portion of a river valley, adjacent to the river channel, which is covered with water when the river overflows during floods.
<b>flood tide</b>	The inflow of coastal waters into bays and estuaries caused by the rising tide.
<b>habitat</b>	The places in which an organism lives and grows. Many estuarine organisms require different habitats at different stages of their life cycles.
<b>hydraulic regime</b>	The variation of estuarine discharges in response to seasonal freshwater inflows and diurnal tides.
<b>levee</b>	A man-made embankment or wall built to exclude floodwaters, or a natural embankment adjacent to a waterway built by the deposition of silt from floodwaters.
<b>littoral drift processes</b>	Wave, current and wind processes that facilitate the transport of sediments along a shoreline.
<b>management plan</b>	A document including, as appropriate, both written and diagrammatic information describing how a particular area of land is to be used and managed to achieve defined objectives. It may also include description and discussion of various issues, problems, special features and values of the area, the specific management measures which are to apply and the means and timing by which the plan will be implemented.
<b>mangroves</b>	An intertidal plant community dominated by trees.
<b>neap tides</b>	Tides with the smallest range in a monthly cycle. Neap tides occur when the sun and moon lie at right angles relative to the earth (the gravitational effects of the moon and sun act in opposition on the ocean).
<b>nutrients</b>	Substances containing or conveying nourishment. Common nutrients are phosphorus and nitrogen.
<b>phase lag</b>	Difference in time of the occurrence between high (or low water) and maximum flood (or ebb) velocity at some point in an estuary.
<b>recruitment</b>	The addition of new members to an existing population, such as the settling of planktonic fish and crustacean larvae into seagrass beds.

<b>riparian vegetation</b>	Vegetation growing along banks of rivers, including the brackish upstream reaches of an estuary.
<b>salinity</b>	The total mass of dissolved salts per unit mass of water. Seawater has a salinity of about 35 g/kg or 35 parts per thousand .
<b>salt wedge</b>	The wedge-shaped body of saltwater that underlies freshwater in poorly-mixed estuaries.
<b>sediment load</b>	The quantity of sediment moved past a particular cross-section in a specified time.
<b>shoaling</b>	The influence of the seabed on wave behaviour. Such effects only become significant in water depths of 60m or less. Manifested as a reduction in wave speed, a shortening in wave length and an increase in wave height.
<b>shoals</b>	Shallow areas in an estuary created by the deposition and build-up of sediments.
<b>spring tides</b>	Tides with the greatest range in a monthly cycle, which occur when the sun, moon and earth are in alignment (the gravitational effects of the moon and sun act in concert on the ocean) .
<b>tidal exchange</b>	The proportion of the tidal prism that is flushed away and replaced with 'fresh' coastal water each tide cycle.
<b>tidal excursion</b>	The distance travelled by a water particle from low water slack to high water slack and vice versa.
<b>tidal lag</b>	The delay between the state of the tide at the estuary mouth (e.g. high water slack) and the same state of tide at an upstream location.
<b>tidal limit</b>	The most upstream location where a tidal rise and fall of water levels is discernible. The location of the tidal limit changes with freshwater inflows and tidal range.
<b>tidal planes</b>	A series of water levels that define standard tides, e.g. 'Mean High Water Spring' (MHWS) refers to the average high water level of spring tides.
<b>tidal prism</b>	The total volume of water moving past a fixed point on an estuary during each flood tide or ebb tide.
<b>tidal propagation</b>	The movement of the tidal wave into and out of an estuary.
<b>tidal range</b>	The difference between successive high water and low water levels. Tidal range is maximum during spring tides and minimum during neap tides.

**tides**

The regular rise and fall of sea level in response to the gravitational attraction of the sun, moon and planets. Tides along the New South Wales coastline are semi-diurnal in nature, i.e. they have a period of about 12.5 hours.

**topography**

The relief features or surface configuration of an area.

**water quality**

The suitability of the water for various purposes, as measured by the concentration or level of a wide variety of contaminants.

## **Appendix E**

### **Definition of Tidal Planes**

## **Appendix E Definition of Tidal Planes**

For a detailed discussion on tides and tidal analysis see the National Tidal Facility website, [www.ntf.flinders.edu.au](http://www.ntf.flinders.edu.au), or the Manly Hydraulics Laboratory website, [www.mhl.nsw.gov.au](http://www.mhl.nsw.gov.au).

### *HHW(SS) – Higher High Water (Spring Solstices)*

The highest of the high waters (or single high water) of any specified tidal day due to the declination effects of the moon and sun.

### *MHWS – Mean High Water Springs*

The height of the MHWS is the average, throughout a year when the average maximum declination of the moon is  $23.5^\circ$ , of the heights of two successive high waters during those periods of 24 hours (approximately once a fortnight) when the range of the tide is greatest.

### *MHW – Mean High Water*

The average of all the high water heights observed over the National Tidal Datum Epoch. For stations with shorter series, simultaneous observational comparisons are made with a control tide station in order to derive the equivalent datum.

### *MHWN – Mean High Water Neaps*

The height of the MHWN is the average, throughout a year when the average maximum declination of the moon is  $23.5^\circ$ , of the heights of two successive high waters during those periods of 24 hours (approximately once a fortnight) when the range of the tide is least.

### *MSL – Mean Sea Level*

The average level of the sea surface over a long period, preferably 18.6 years or more, or the average level which would exist in the absence of tides.

### *MLWN - Mean Low Water Neaps*

The height of the MLWN is the average, throughout a year when the average maximum declination of the moon is  $23.5^\circ$ , of the heights of two successive low waters during those periods of 24 hours (approximately once a fortnight) when the range of the tide is least.

### *MLW – Mean Low Water*

The average of all the low water heights observed over the National Tidal Datum Epoch. For stations with shorter series, simultaneous observational comparisons are made with a control tide station in order to derive the equivalent datum.

### *MLWS – Mean Low Water Springs*

The height of the MLWS is the average, throughout a year when the average maximum declination of the moon is  $23.5^\circ$ , of the heights of two successive low waters during those periods of 24 hours (approximately once a fortnight) when the range of the tide is greatest.

### *ISLW – Indian Spring Low Water*

The lowest level to which a tide will fall under exceptional, predictable, astronomical conditions. It seldom occurs. Meteorological and oceanographical influences, which cannot be predicted, can cause the tide to fall even lower.

*MSR – Mean Spring Range*

The difference obtained by subtracting the MLWS plane level from the MHWS plane level.

*MNR – Mean Neap Range*

The difference obtained by subtracting the MLWN plane level from the MHWN plane level.
